Introduction & Motivation

- More people seeking online medical service during the Covid-19 pandemic
- Natural language processing and machine learning techniques
- Our project aims to help with the automation of the initial classification of medical symptoms, which will greatly save time in matching patients with the correct doctors.
- This is a text classification project that finds the best combination of textual feature extraction methods and multi-class classification algorithms that can be used to classify the ailments based on some phrases the patients entered.

Literature Review

Existing works in the scope of healthcare

- Chaitrashree, K.M. and his colleagues developed an app called MedAid for those who want to self-diagnose their illness. They trained the model using 4 different machine learning algorithms with bag-of-words extracted features.
- Pendyala, V. S. and his colleagues confirmed the feasibility of the text-mining approach to the medical diagnosis problem and pointed out that the future of this sort of study should be using the Hadoop ecosystem to improvise the results

Overview elements in text classification

- Mirończuk, M. M. claims the framework of text classification can be divided into data acquisition, labeling, feature construction, dimensionality reduction, and last and most important, training of classifiers

Performance among different classification

- Khursheed, M. S. used an automated process to examine the accuracy, precision, recall, and f-measure in all combinations of feature selection, term weighting, and classification algorithms on the large and diverse Arabic text dataset

Modeling
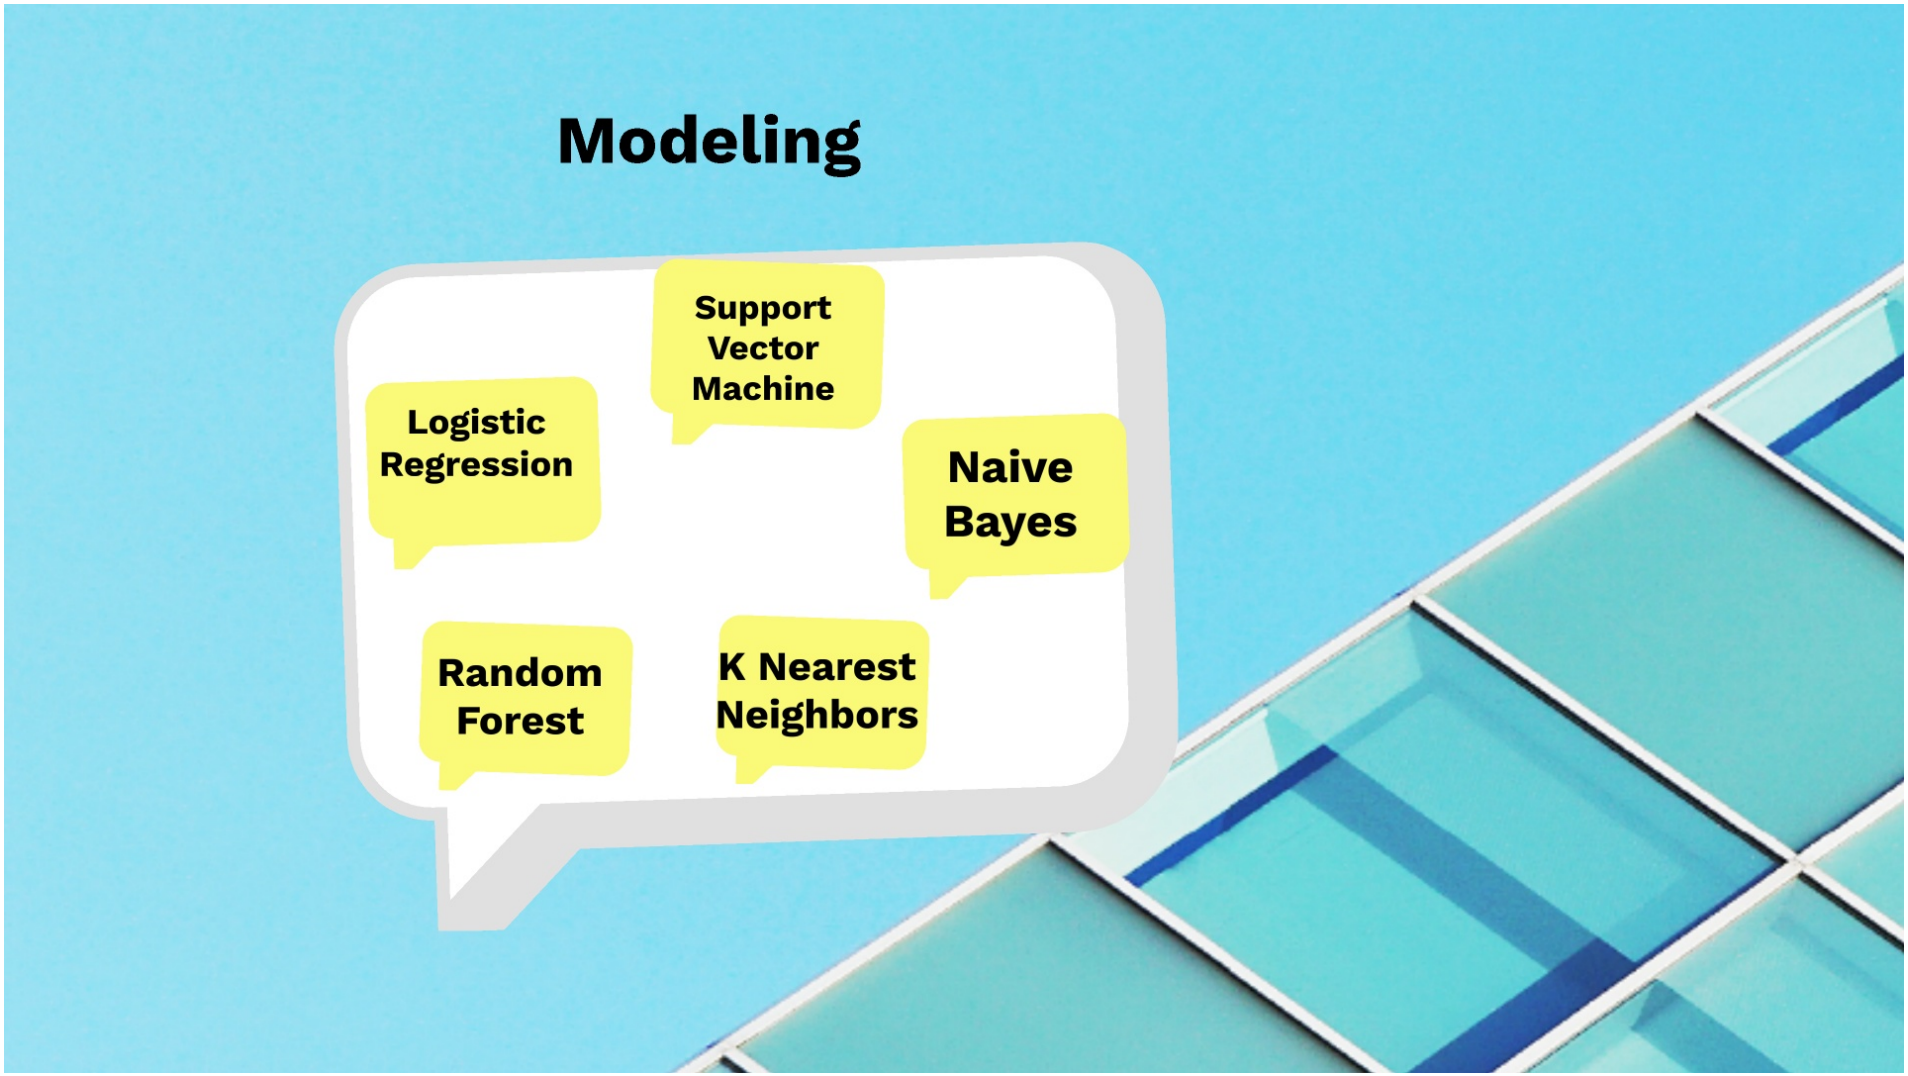
Support Vector Machine
Logistic Regression
Naive Bayes
Random Forest
K Nearest Neighbors

Logistic Regression

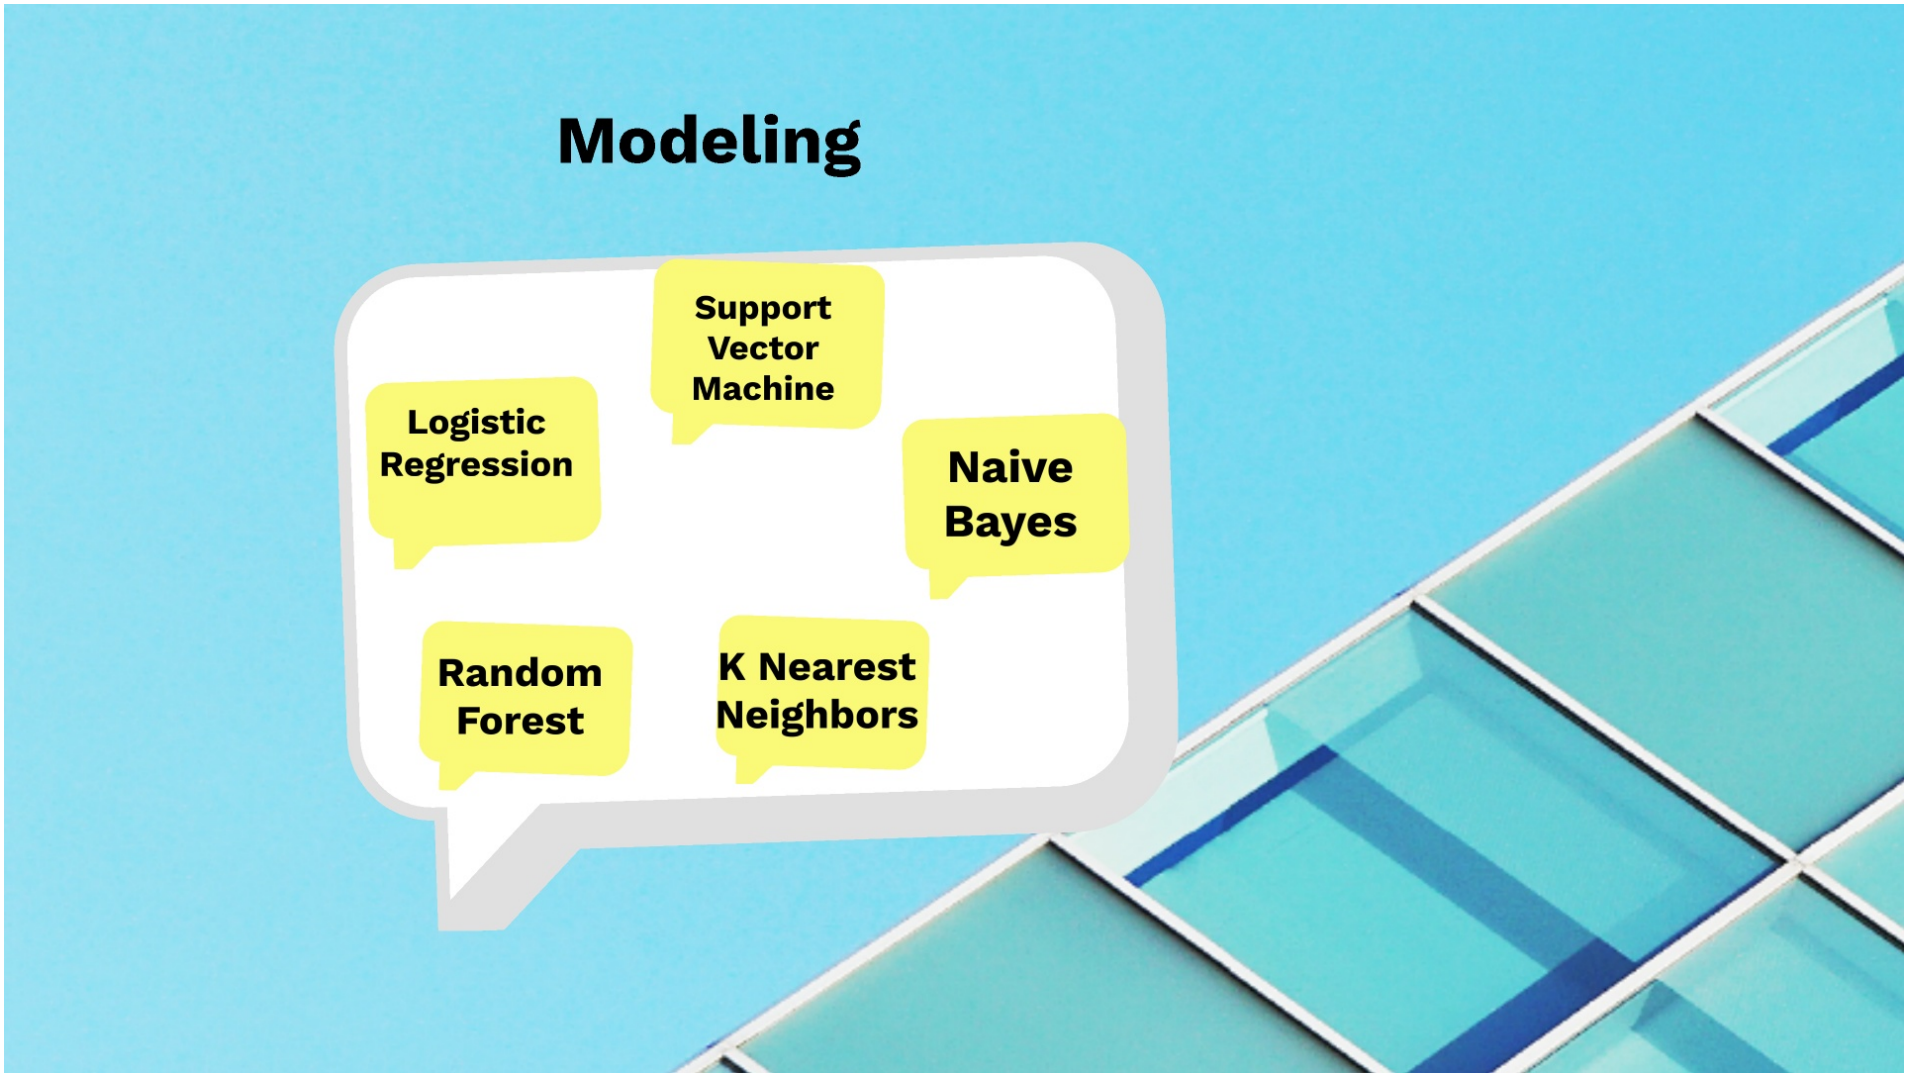
- A discriminative classifier
  - the assumption of a linear relationship
- A probabilistic model
  - returns a probability after applying the logistic transformation
- Logistic function is nonlinear
  - the model is more smooth and robust than linear regression
- An inherently binary-class classifier
  - One Vs Rest methods to build 25 classifiers to predict the class
  - scikit-learn library simplify the work



Modeling
Support Vector Machine
Logistic Regression
Naive Bayes
Random Forest
K Nearest Neighbors

Support Vector Machine

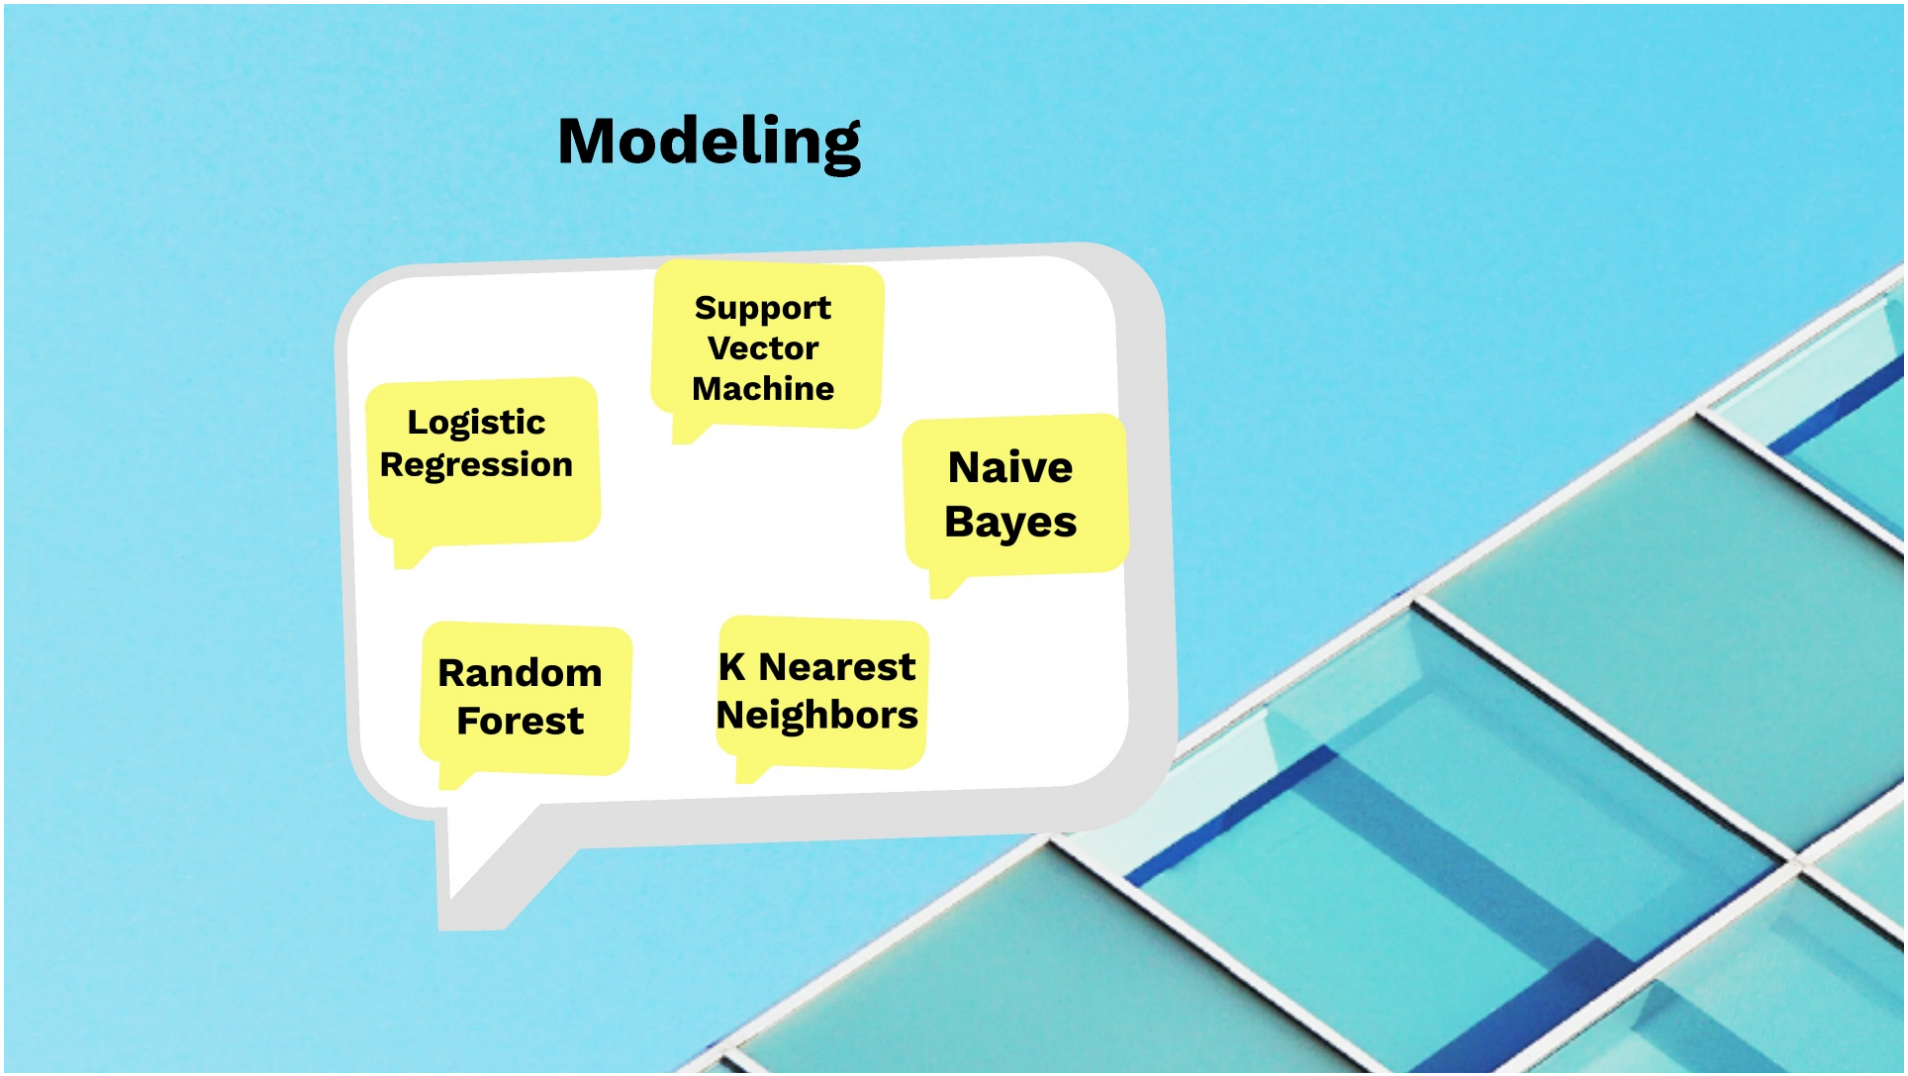
- A margin maximization classifier
  - search for an optimal hyperplane that maximizes the margins
- Considering only support vectors point
  - the points closest to the hyperplane as known as support vectors
  - efficient for high-dimensional and large data sets
- An inherently binary-class classifier
  - One Vs Rest methods to build 25 classifiers to predict the class
  - scikit-learn library simplify the work



Modeling
Support Vector Machine
Logistic Regression
Naive Bayes
Random Forest
K Nearest Neighbors

Naive Bayes

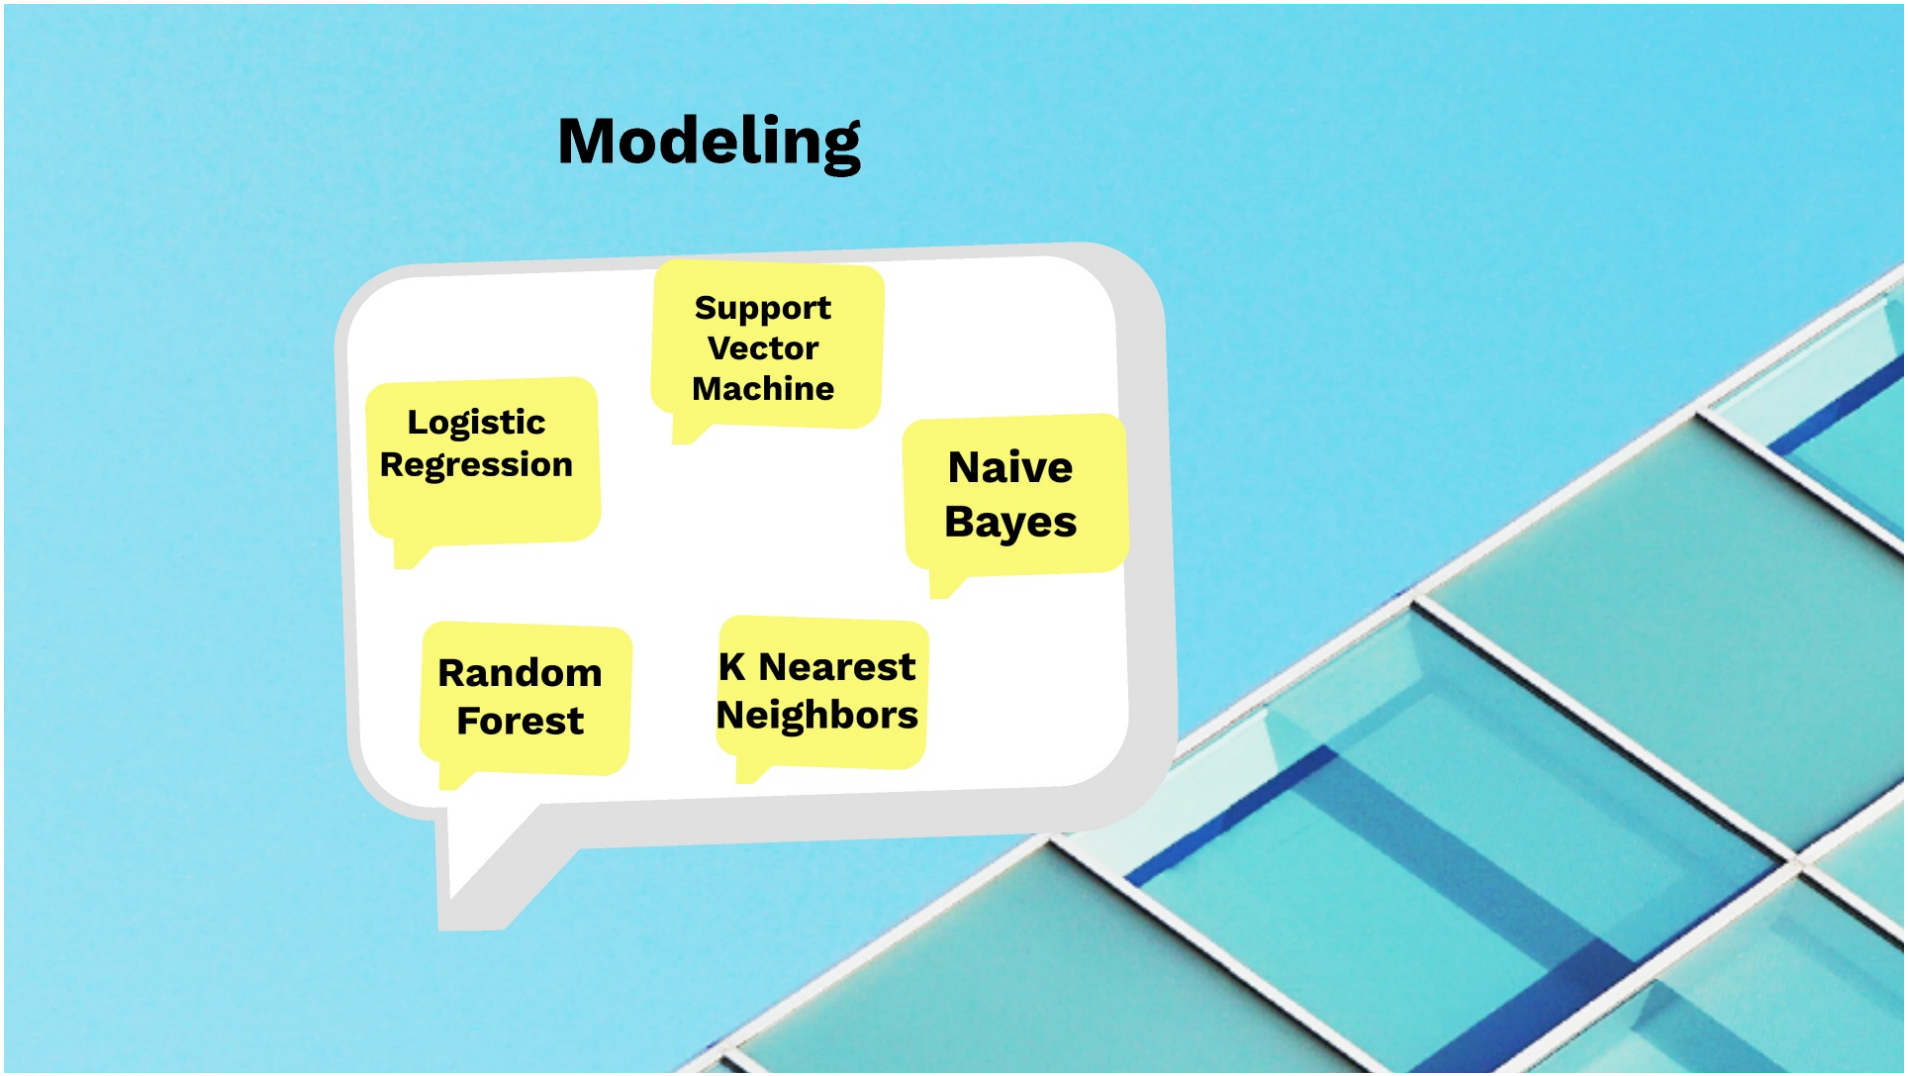
- A generative model
  - derive the actual probability of class given data features
  - needs a significant amount of data to get accurate likelihood probabilities
- Relied on strong assumptions
  - Our text features are not conditional independent
  - Hard to assume data distribution for transformed features: Gaussion, multinomial?
- An inherently multi-class classifier
  - find likelihood probabilities for each class
  - implement using scikit-learn library



Modeling
Support Vector Machine
Logistic Regression
Naive Bayes
Random Forest
K Nearest Neighbors

K Nearest Neighbors

- A memory-based learning model
  - stores feature vectors of training data points in the memory
  - modeling after receive test data points
- A distance-based method
  - data should be normalized
  - handle highly nonlinear decision boundaries and doesn't assume the decision boundary's shape
  - sensitive to hyperparameters choice
- An inherently multi-class classifier
  - predicts the class of unseen data based on the class of neighbors that appears the most time
  - implement using scikit-learn library



Modeling
Support Vector Machine
Logistic Regression
Naive Bayes
Random Forest
K Nearest Neighbors

Random Forest

- An ensemble model
  - consists of a large number of individual decision trees
  - individual trees are trained on random subsets of features and samples
- Learn from individual trees' errors
  - data need to be preprocessed so that their errors can be least correlated\
  - sensitive to hyperparameter choices
- An inherently multi-class classifier
  - predicts the class with the most votes from those trees
  - implement using scikit-learn library

Naive Bayes
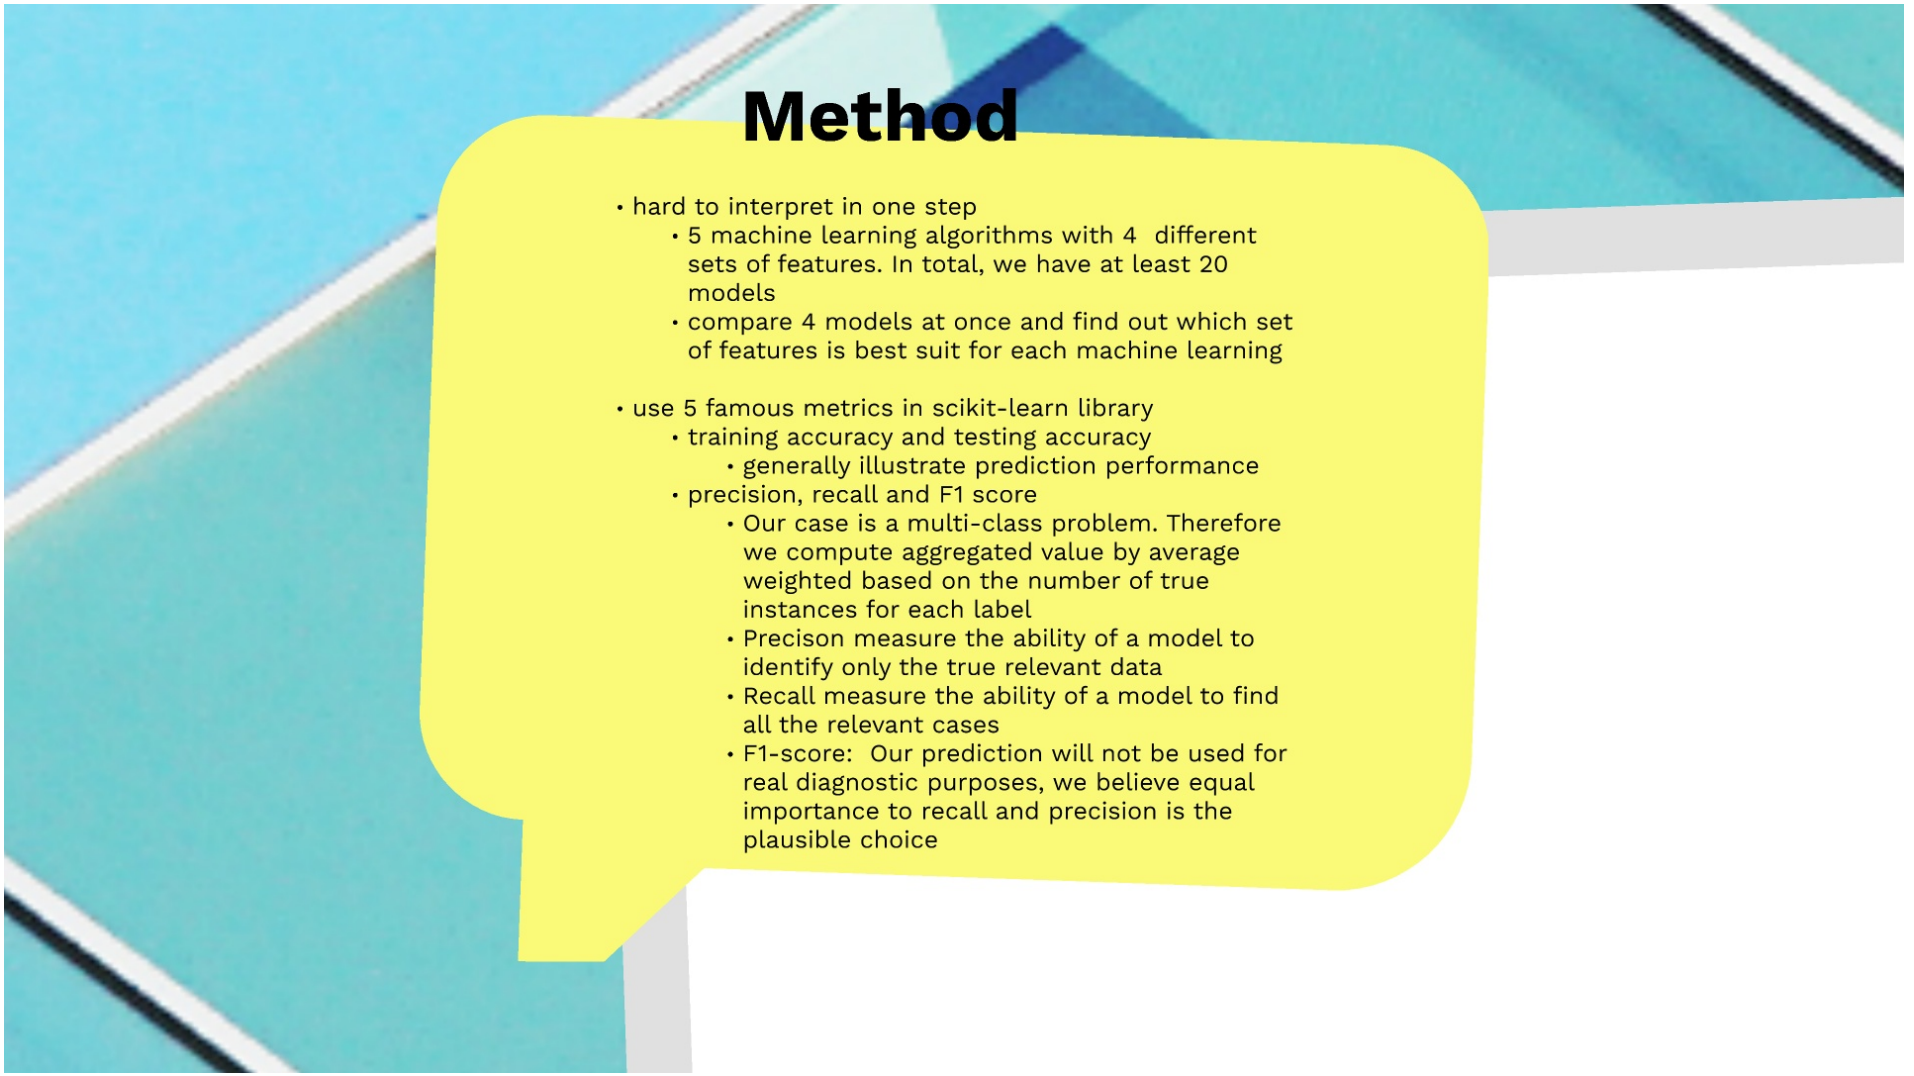
Best
Random Forest



Method

- hard to interpret in one step
  - 5 machine learning algorithms with 4 different sets of features. In total, we have at least 20 models
  - compare 4 models at once and find out which set of features is best suit for each machine learning

- use 5 famous metrics in scikit-learn library
  - training accuracy and testing accuracy
    - generally illustrate prediction performance
  - precision, recall and F1 score
    - Our case is a multi-class problem. Therefore we compute aggregated value by average weighted based on the number of true instances for each label
    - Precison measure the ability of a model to identify only the true relevant data
    - Recall measure the ability of a model to find all the relevant cases
    - F1-score: Our prediction will not be used for real diagnostic purposes, we believe equal importance to recall and precision is the plausible choice

K Nearest Neighbors
Naive Bayes
Best
Random Forest

Naive Bayes

Guassian Naive Bayes Classifier with tf_idf extracted data are the best among all Naive Bayes Classifiers

Gaussian Naive Bayes Classifier with word2vec extracted data has the same performance issue like LR and SVM

Why

4. METRIC TABLE FOR GAUISSIAN NAIVE BAYES

Model	Training Accuracy %	Testing Accuracy %	Testing Precision %	Testing Recall %	Testing F1 Score %
GNB_bow	90.653153	87.546887	87.546887	89.318237	87.667300
GNB_tf-idf	90.878378	87.921980	87.921980	90.570234	88.415025
GNB_hash	79.298048	75.843961	75.843961	77.614749	76.140452
GNB_w2v	47.184685	48.012003	48.012003	50.995666	48.054367

All dataset has been preprocessed with same step and been extracted PCA components based on 99% variance. The only difference is that word2vec dataset contains only 8 features. We assume the reason behind is those models needs a significant amount of data in high dimensions to get either plausible decision boundaries or accurate likelihood probabilities.

Naive Bayes

Guassian Naive Bayes Classifier with tf_idf extracted data are the best among all Naive Bayes Classifiers

Gaussian Naive Bayes Classifier with word2vec extracted data has the same performance issue like LR and SVM

Why

4. METRIC TABLE FOR GAUISSIAN NAIVE BAYES

Model	Training Accuracy %	Testing Accuracy %	Testing Precision %	Testing Recall %	Testing F1 Score %

Best
Random Forest

K Nearest Neighbors

- K Nearest Neighours with bag-of-words extracted data is the best among all KNNs.
- K Nearest Neighours have high scores in every metric and are consistent with all kind of feature dataset
- Tune hyperparameters
  - choice of distance metrics including ‘euclidean’ and ‘manhattan’
  - the number of K neighbors
  - the choice of weight function for K neighbors
    - ‘uniform’ in which All points in each neighborhood are weighted equally
    - ‘distance’ in which weight points by the inverse of their distance.

7. Metric Table for K Nearest Neighbors

Model	Training Accuracy %	Testing Accuracy %	Testing Precision %	Testing Recall %	Testing F1 Score %

Real World Application & Significance

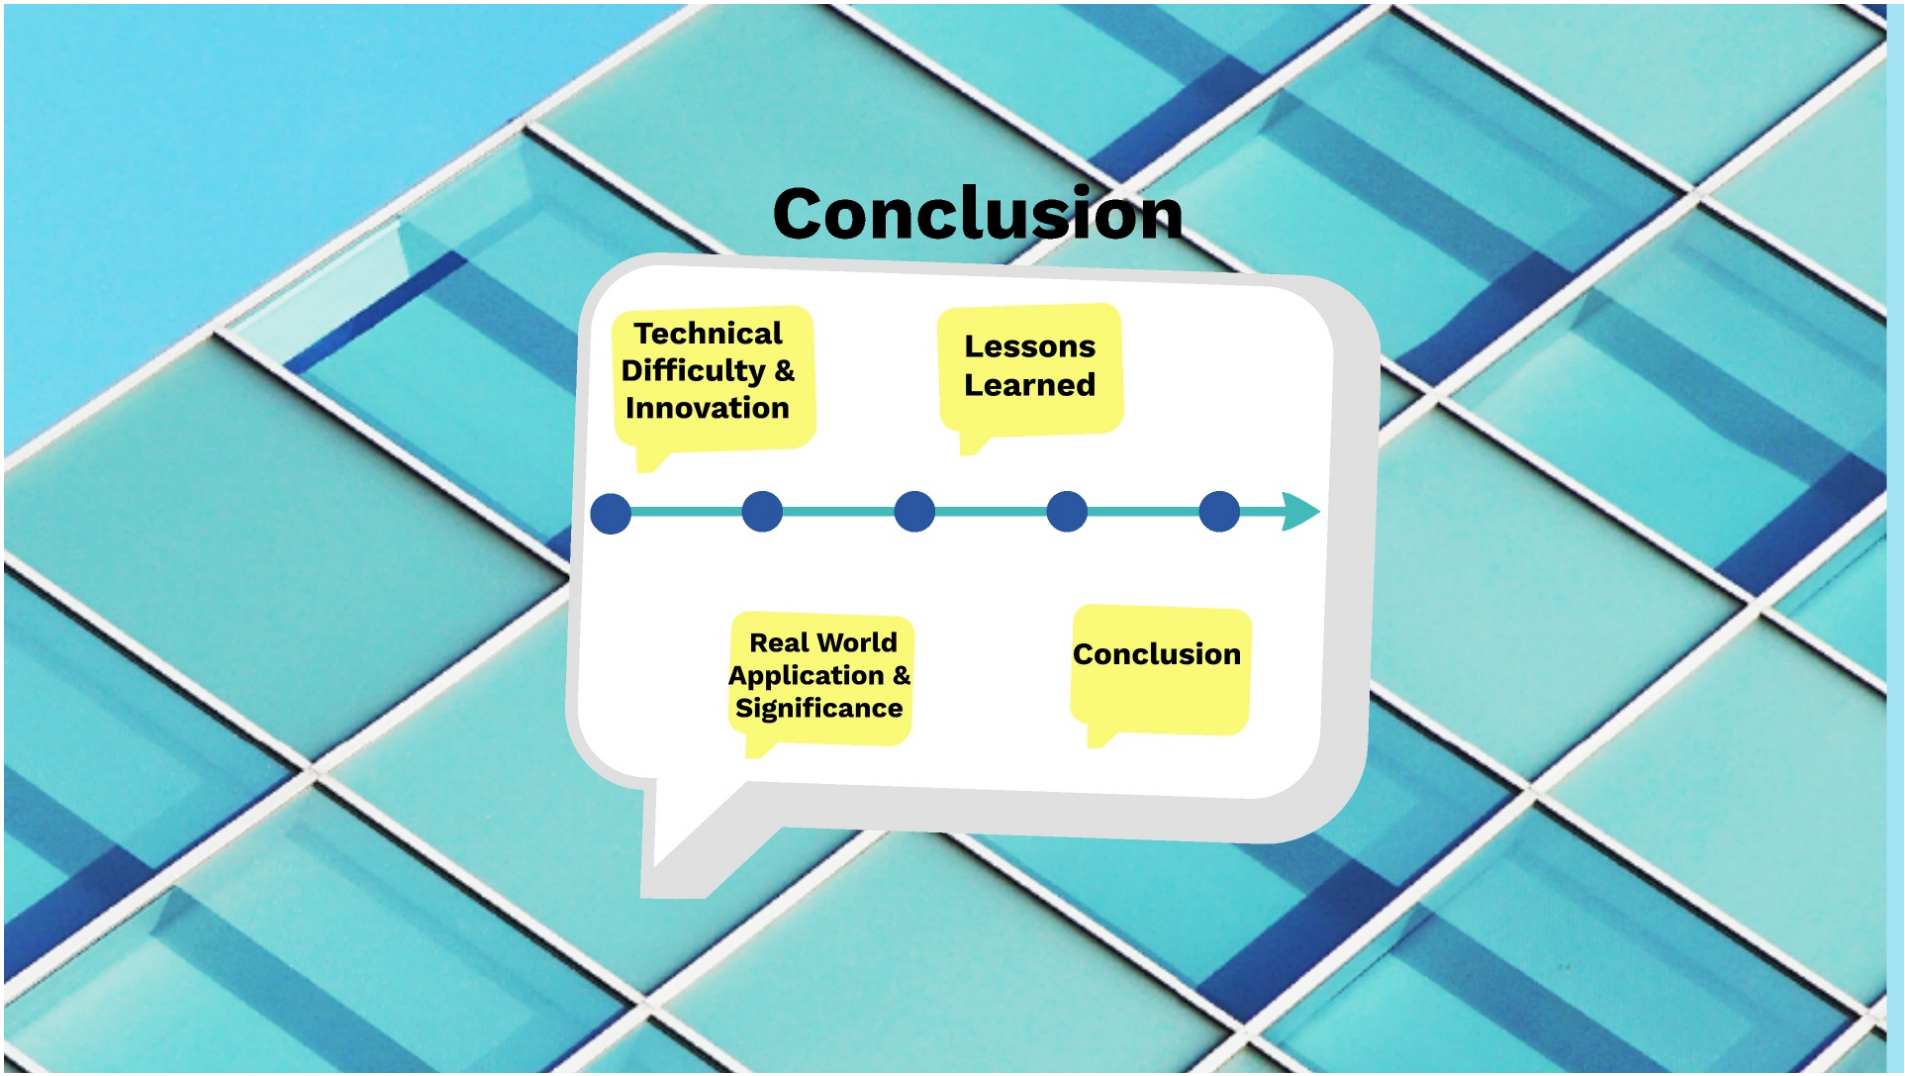
As Covid-19 pandemic significantly skyrockets the demand of online medical services, our the medical symptoms text classification system we designed is easily applicable in various medical institutions, adding significant and meaningful life saving and business values to the real world.

- Assisting the medical service institution to identify the patients' symptoms based on text messages, classifying accordingly and transfer to the medical departments with high accuracy and high efficiency.
- Significant reduce direct human contact which reduces the chance of spreading highly infectious diseases like Covid-19.
- Can further extend to be used on the online chat box and auto-reply text messages sent to the phone.



Conclusion
Technical Difficulty & Innovation
Lessons Learned
Real World Application & Significance
Conclusion

Lessons Learned

- Practiced the full cycle of machine learning project including data collection, data processing, modeling, evaluation and deployment
- Features engineering significantly impact the performance of model
    - different sets of algorithms and features perform differently
    - Aggregated word2vec feature set is not suit for LR, SVC, and Gauissan NB
    - Hash vectorized method is apparently weaker than all others
- Accuracy is not an adequate metric especially when models perform nearly perfect
    - There are classes some classifiers have never predicted but still have high accuracy as those classes comprise very small amount in all data
    - During deployment we test some random input and the result seems unexpected even though our accuracy in evaluation is extremely high. Therefore, our model can't really understand the dependency between features and class since we lack of support data - 25 classes but only 6000 support data .

Future Works

Future Works

- Improving Data Quality to solve the issue of data imbalance and lack of support data
  - collecting more support data
  - binning some classes together to form a more high-level class.
- Deployment with dynamic model
  - model can be continuously improved
  - mitigate our data issue

Lessons Learned

- Practiced the full cycle of machine learning project including data collection, data processing, modeling, evaluation and deployment
- Features engineering significantly impact the performance of model
    - different sets of algorithms and features perform differently
    - Aggregated word2vec feature set is not suit for LR, SVC, and Gauissan NB

Conclusion

Conclusion

Our model of choice is the tuned random forest classifier using the Word2Vec extracted features. It gives the 99.69% accuracy, 99.69% precision, and 99.71% recall scores in the task of diagnosis classification. It is the model with the best performance compared to the other 21 models.

Our application not only enables patients to early identify the ailment and take preventative actions in advance but also serves as a bridge between patients and real doctors by saving time in matching patients

Our project requiring further work including data quality improving and further digging the relation between features and algorithms to answer why they fit or not. Until that, our model can't really have a realistic and applicable usage

Thank You
